REPORT HISTORY

Report Number	Revision	Description	Issue Date
23T04Z80808-01	Rev.0	1st edition	2024-04-12
23T04Z80808-01	Rev.1	Add the external antenna information in P7. Recalculated the results of “Unwanted Emission” and “Band Edge Compliance” used external antenna gain. Add the note “The gain of external antenna is larger than the gain of internal antenna, and it should be considered that the EUT with external antenna is the worst case. All the tests are used external antenna.” in P11.	2024-04-23

Note: the latest revision of the test report supersedes all previous version.

CONTENTS

1. Test Laboratory

1.1. Introduction & Accreditation

Telecommunication Technology Labs, CAICT is an ISO/IEC 17025:2017 accredited test laboratory under American Association for Laboratory Accreditation (A2LA) with lab code 7049.01, and is also an FCC accredited test laboratory (CN1349), and ISED accredited test laboratory (CAB identifier:CN0066). The detail accreditation scope can be found on A2LA website.

1.2. Testing Location

Location 1: CTTL(huayuan North Road)

Address: No. 52, Huayuan North Road, Haidian District, Beijing, P. R. China 100191

Location 2: CTTL(Kangding)

Address: No. 18A, Kangding Street, Beijing Economic-Technology Development Area, Beijing, P. R. China 100191

1.3. Testing Environment

Extreme Temperature: -30/+50℃

Relative Humidity: 20-75%

1.4. Project Data

Testing Start Date: 2024-02-29

Testing End Date: 2024-03-29

1.5. Signature

3. Equipment Under Test (EUT) and Ancillary Equipment (AE)

3.1. About EUT

Description	5G Outdoor CPE
Model Name	SRT853L
FCC ID	2AG32SRT853L
Hardware revision	SRT853L_PCB_V1.00
Software revision	SRT853L_8.0.6_EQ100
mmW Frequency band	n261
IBW	50MHz/100MHz
Max Output power (EIRP)	57.62dBm
Antenna beam steering	Beam26&Beam282 Beam30&Beam286(Reference Beam Tables are showed in Annex E)
Internal antenna gain	16dBi
External antenna gain	30.4dBi
Channel bandwidth(s)/ Sub Carrier Spacing	50MHz or100 MHz/ 120 kHz
Modulations	CP-OFDM(QPSK, 16QAM, 64QAM, 256QAM) DFT-s-OFDM(PI/2 BPSK, QPSK, 16QAM, 64QAM, 256QAM)
Extreme vol. Limits	56VDC (POE)
Extreme temp. Tolerance	-40°C to +50°C

Note: Components list, please refer to documents of the manufacturer; it is also included in the original test record of CTTL.

Test frequencies used for radiated measurements:

Frequency (MHz)	bandwidth	CCs	comment
27525.00	50MHz	1	Low channel
27924.96	50MHz	1	middle channel
28324.92	50MHz	1	high channel
27550.08	100MHz	1	Low channel
27924.96	100MHz	1	middle channel
28299.96	100MHz	1	high channel
27550.08 + 27650.04	100MHz	2	Low channel
27874.92 + 27974.88	100MHz	2	middle channel
28200.00 + 28299.96	100MHz	2	high channel

3.2. Internal Identification of EUT used during the test

EUT ID*	IMEI / Serial Number	HW Version	SW Version
UT01a	T853L6AAxD092800027	SRT853L_PCB_V1.00	SRT853L_8.0.6_EQ100

*EUT ID: is used to identify the test sample in the lab internally.

The IMEI and SW version information were provided by the applicant.

3.3. Internal Identification of AE used during the test

AE ID*	Description	Model	Manufacturer
AE1	POE Adapter	P060U04	I.T.E. POWER SUPPLY

4. Reference Documents

4.1. Documents supplied by applicant

EUT parameters, referring to chapter 3.1 for detailed information, is supplied by the client or manufacturer, which is the basis of testing.

4.2. Reference Documents for testing

The following documents listed in this section are referred for testing.

Reference	Title	Version
FCC Part 30	UPPER MICROWAVE FLEXIBLE USE SERVICE	10-1-23 Edition
ANSI C63.26	American National Standard for Compliance Testing of Transmitters Used in Licensed Radio Services	2015
KDB 842590	Upper Microwave Flexible Use Service v01r02	April 20, 2021

5. Laboratory Environment

Semi/Full-anechoic chamber did not exceed following limits along the EMC testing:

Temperature	Min. = 15 ˚C, Max. = 35 ˚C
Relative humidity	Min. = 15 %, Max. = 75 %
Shielding effectiveness	0.014MHz - 1MHz, >60dB; 1MHz - 1000MHz, >90dB.
Electrical insulation	> 2 M
Ground system resistance	< 4
Normalised site attenuation (NSA)	< ± 4 dB, 3m/10m distance, from 30 to 1000 MHz
Site voltage standing-wave ratio (SVSWR)	Between 0 and 6 dB, from 1GHz to 18GHz

6. Summary Of Test Result

n261

Items	Test Name	Clause in FCC rules	limit	Verdict
1	Output Power	2.1046 30.202(a)	75dBm/100 MHz	P
2	Unwanted Emission	30.203	-13dBm/MHz	P
3	Frequency Stability	2.1055	Fundamental emissions stay within authorized frequency block	P
4	Occupied Bandwidth	2.1049	Not Applicable	Reporting only
5	Band Edge Compliance	2.1051 30.203	-5dBm/MHz from the band edge up to 10% of the channel BW	P

Note: The gain of external antenna is larger than the gain of internal antenna, and it should be considered that the EUT with external antenna is the worst case. All the tests are used external antenna.

Terms used in Verdict column

P	Pass. The EUT complies with the essential requirements in the standard.
NP	Not Performed. The test was not performed by CTTL.
NA	Not Applicable.The test was not applicable.
BR	Re-use test data from basic model report.
F	Fail. The EUT does not comply with the essential requirements in the standard.
Reporting only	No limit. Just report the measurement.

Explanation of worst-case configuration

The worst-case scenario for all measurements is based on the output power, occupied bandwidth, band edge emission measurement investigation results. The test results shown in the following sections represent the worst case measurement results. For each frequency only the maximum measurement results of Beam ID were represent in the report. The Beam ID of maximum results for low, center and high frequency of different chains maybe vary.

7. Measurement Uncertainty

Measurement Uncertainty:

Location 2: CTTL(Kangding)

Frequency Range	Uncertainty(dB) (k=2)
30MHz-1GHz	5.64
1GHz-18GHz	4.23
Above 18GHz	3.72

Note: Uncertainty of the above 18GHz, giving only the worst case.

Location 1: CTTL(huayuan North Road)

Frequency Range	Uncertainty(dB) (k=2)
18GHz-40GHz	3.4

8. Test Equipment Utilized

NO.	NAME	TYPE	SERIES NUMBER	PRODUCER	CAL. DUE DATE	CAL. INTERVAL

Test Item	Test Software and Version	Software Vendor
Output Power	mmWave InBand testing V1.2.2	CAICT
Unwanted Emission	mmW Spurious Emission V5.0	CAICT
Occupied Bandwidth	mmWave InBand testing V1.2.2	CAICT
Band Edge Compliance	mmWave InBand testing V1.2.2	CAICT

Annex A: Radiated Test Setup

The radiated test facilities consisted of an indoor 3m/10m semi-anechoic chamber used for final measurements and exploratory measurements from 30MHz-18GHz, when necessary for radiated emissions measurements in the spurious domain. According to Clause 5 in ANSI C63.4-2014, absorbers are arranged on the floor between the turn table and the antenna mast in such a way so as to maximize the reduction of reflections for measurements above 1GHz (Figure A.2). For measurements below 1GHz, the absorbers are removed (Figure A.1).

Radiated measurement test sites shall conform to the site validation criteria called out in CISPR 16-1-4:2019 above 18 GHz. The test object is mounted on a positioner (Figure A.3). The positioner is used to move the test object according to the sampling grid. A measurement antenna is placed in the chamber at a suitable measurement antenna far-field distance.

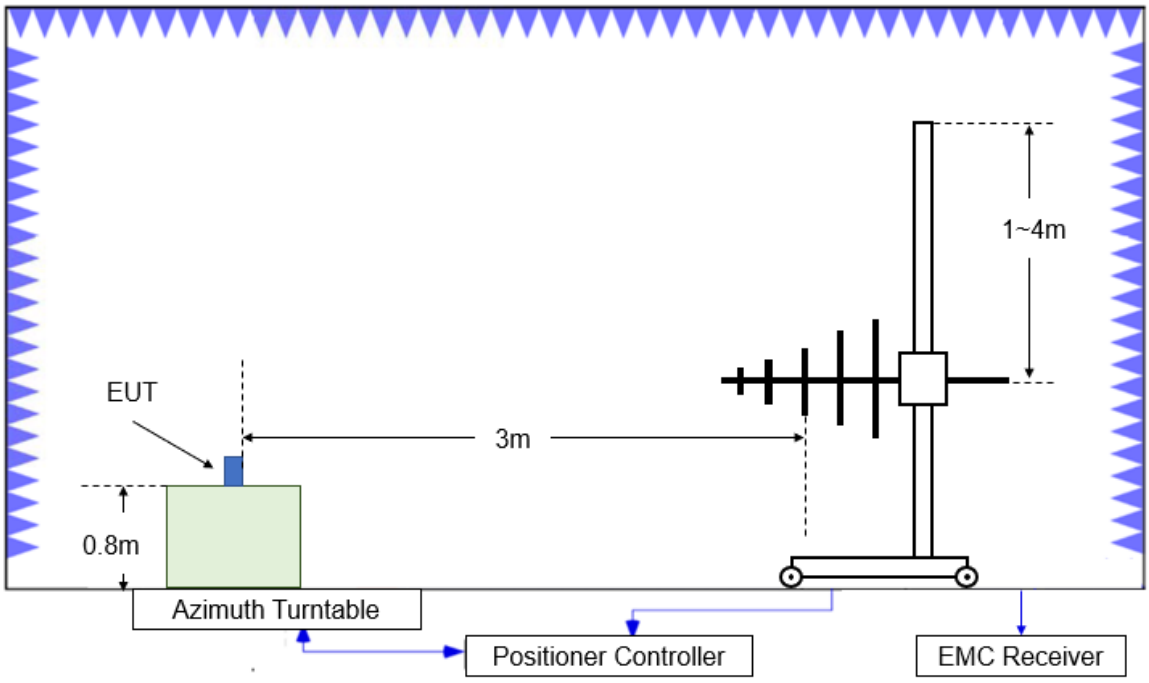

Figure A.1. Test Site Diagram (30MHz-1GHz)

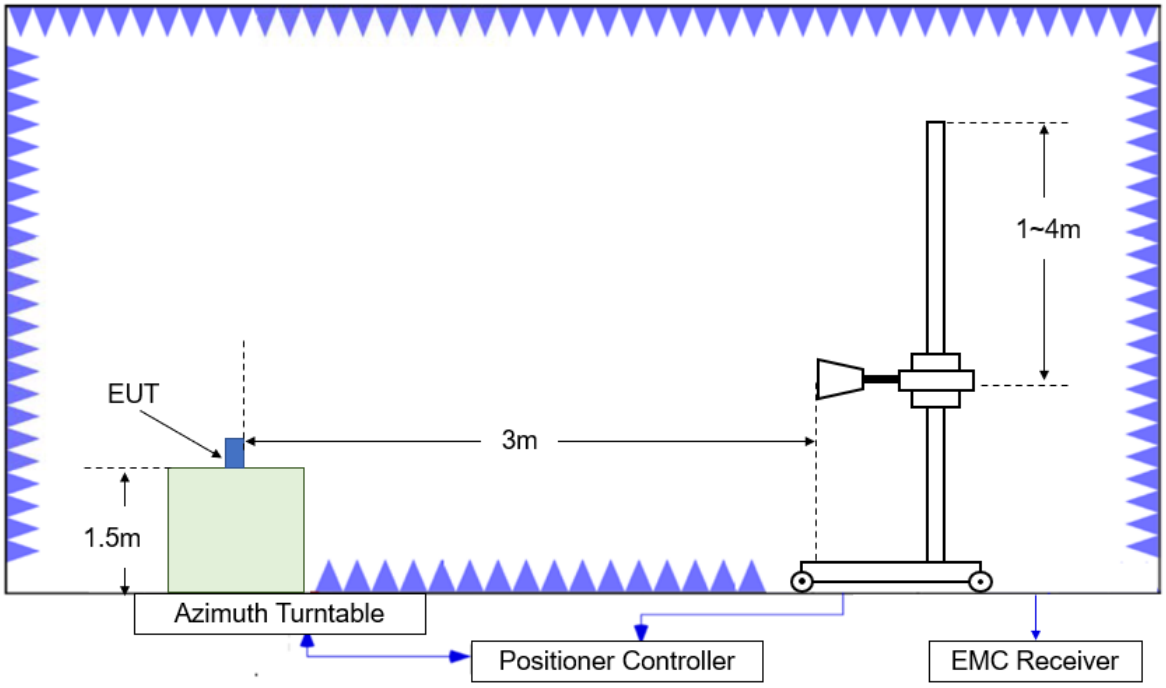

Figure A.2. Test Site Diagram (1GHz-18GHz)

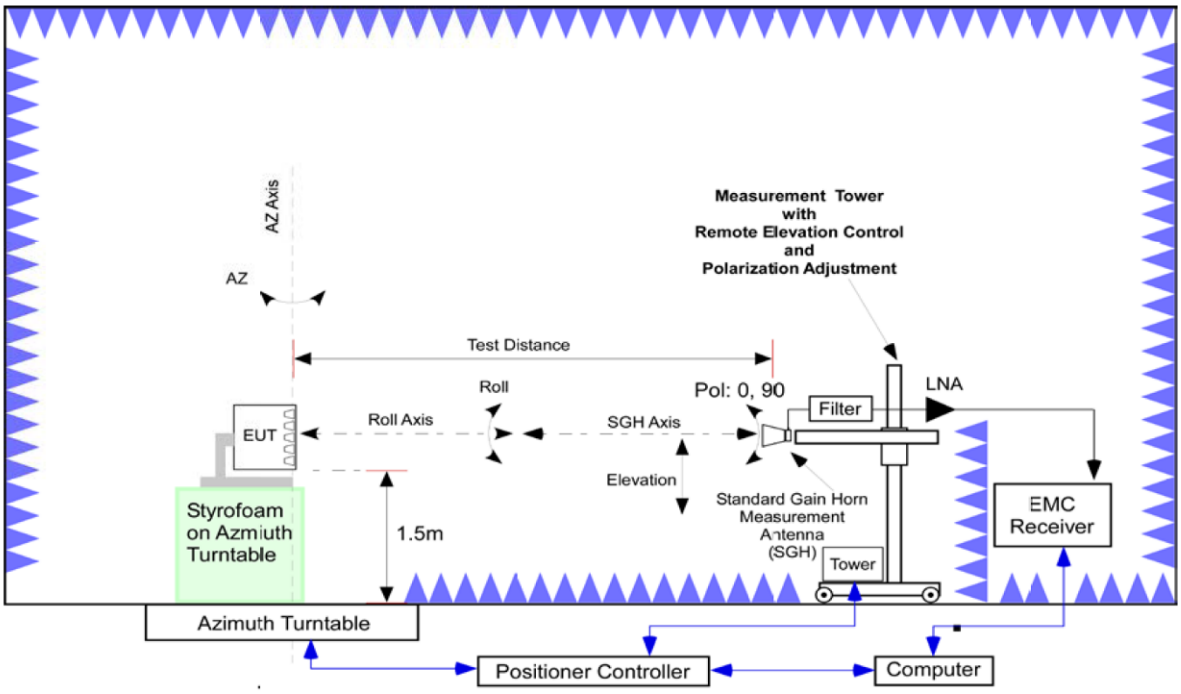

Figure A.3. Test Site Diagram (above18GHz)

Annex B: Measurement Results

B.1 Radiated Output Power

B.1.1 Summary

In all cases, output power is within the specified limits.

30.202 (a) For fixed and base stations operating in connection with mobile systems, the average power of the sum of all antenna elements is limited to an equivalent isotopically radiated power (EIRP) density of +75dBm/100 MHz. For channel bandwidths less than 100 MHz the EIRP must be reduced proportionally and linearly based on the bandwidth relative to 100 MHz.

B.1.2 Minimum Measurement Distance Evaluation

According to KDB842590 D01, the measurements of the fundamental emission, out of band, harmonics and spurious emissions shall be made in the far field of the measurement antenna. The far-field boundary for mmW antennas is greater than or equal to $2D^2/\lambda$ (with D being the largest dimension of the antenna, and λ the wavelength of the emission). We calculate the far-field boundary and the test distance meet the requirement of standard.

For fundamental or out-of-band emissions the largest far-field distance of either the EUT antenna or measurement antenna shall be used. For spurious emissions the far-field distance will be based on the measurement antenna.

	Antenna	D(mm)	λ(mm)	far-field boundary (m)	Measurement distance(m)
18-40GHz	EUT mmW Antenna	33.65	16.8	0.37	3

B.1.3 Method of Measurements

ANSI C63.26 chapter 5.5.2.1: Such radiated measurements shall use substitution methods unless a test site validated to ANSI C63.4 requirements is utilized, in which case, radiated fundamental and/or unwanted emissions can be measured using the direct radiated field strength method.

The EUT was set up for the max output power with pseudo random data modulation.

These measurements were done at 3 frequencies (bottom, middle and top of operational frequency range) for each bandwidth.

An spectrum analyzer is used to perform RF output power measurements, the fundamental condition that measurements be performed only over durations of active transmissions at maximum output power level applies. Thus, a spectrum analyzer can always be used to perform the measurement when the EUT can be configured to transmit continuously.

The EIRP measurement used integration method and the bandwidth is 100MHz.

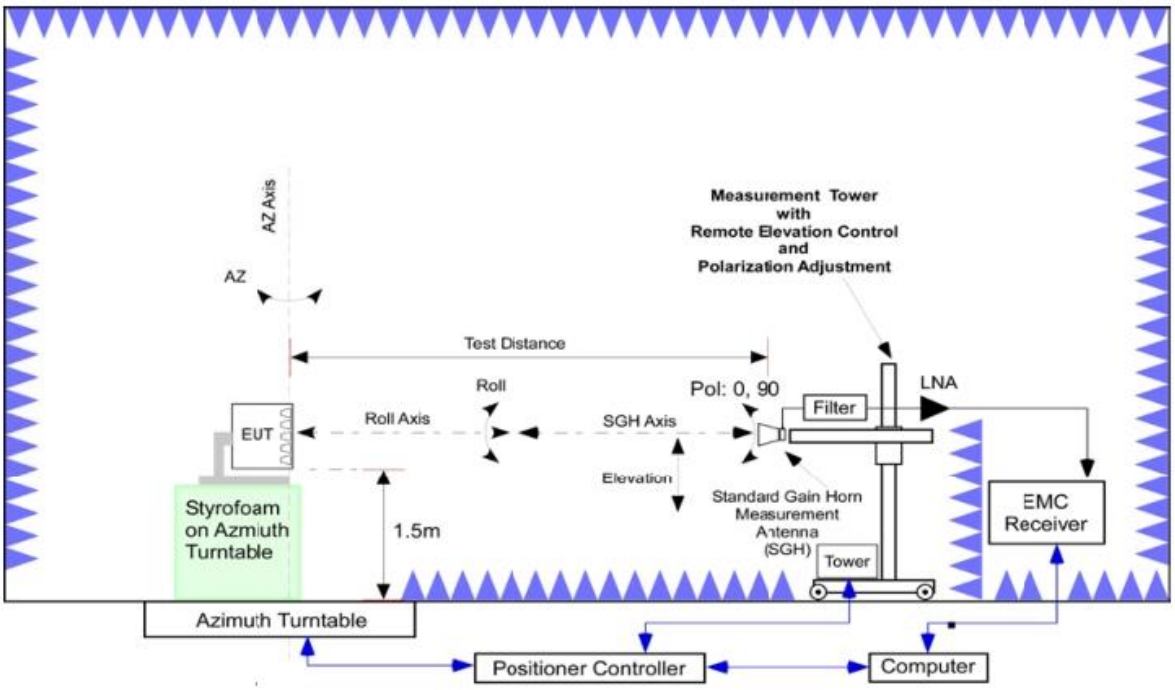
B.1.4 Test Procedure

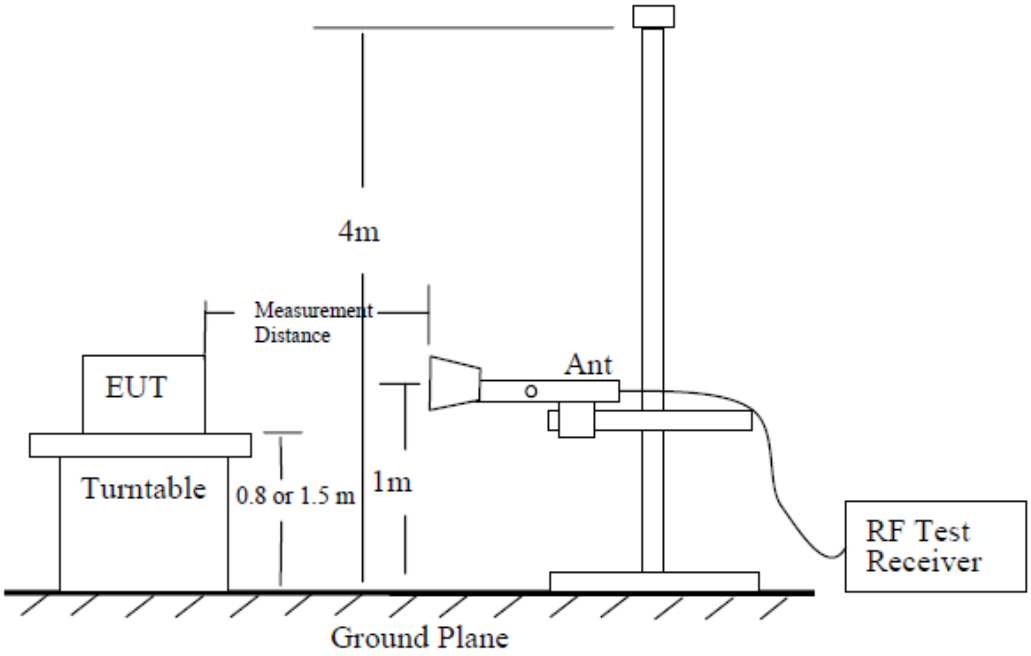
According to Clause 5.2.4.4 in ANSI C63.26-2015 and Clause 4.2 in KDB 842590 D01 v01r02

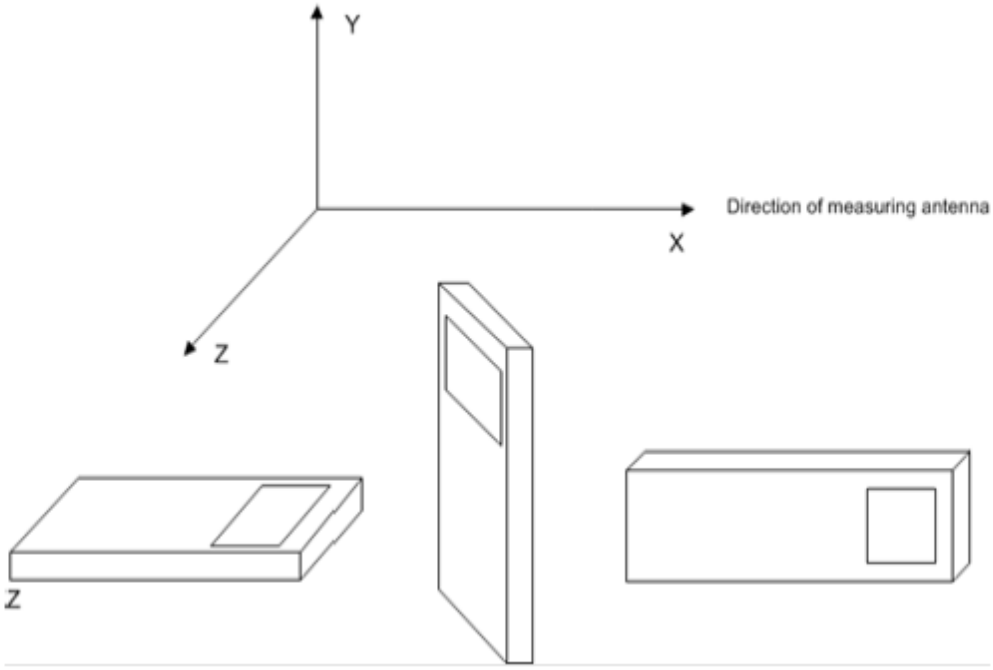
1. Set EUT at maximum output power
2. Select channels for each band and proper modulation

3. Enable channel power measurement function of spectrum analyzer
4. Set RBW = 1% to 5% of the OBW, not to exceed 1MHz
5. Set VBW ≥ 3×RBW
6. Set span to 2× to 3× the OBW
7. Set number of measurement points in sweep ≥ 2×span/RBW
8. Set Detector = RMS (power averaging)
9. Set Sweep time = auto-couple
10. Trace average at least 100 traces in power averaging (rms) mode
11. Compute the power by integrating the spectrum across the OBW of the signal for signals with continuous operation

Using the test configuration as follow, measure the radiated emissions directly from the EUT and convert the measured field strength or received power to ERP or EIRP, as required, for comparison to the applicable limits.







The emission characteristics of the EUT can be identified from the pre-scan measurement information.

Exploratory radiated measurements (pre-scans) may be performed to determine the general EUT radiated emissions characteristics and, when necessary, the EUT-to-measurement antenna orientation that produces the maximum emission amplitude. Pre-scans shall only be used to determine the emission frequencies (i.e., not amplitude levels). The information garnered from a pre-scan can then be used to perform final compliance measurements using either the substitution or direct field strength method.

For radiated emissions measurements performed at frequencies less than or equal to 1 GHz,

the EUT shall be placed on a RF-transparent table or support at a nominal height of 80 cm above the reference ground plane. Radiated measurements shall be made with the measurement antenna positioned in both horizontal and vertical polarization. The measurement antenna shall be varied from 1 m to 4 m in height above the reference ground in a search for the relative positioning that produces the maximum radiated signal level (i.e., field strength or received power). When orienting the measurement antenna in vertical polarization, the minimum height of the lowest element of the antenna shall clear the site reference ground plane by at least 25 cm.

For radiated measurements performed at frequencies above 1 GHz, the EUT shall be placed on an RF transparent table or support at a nominal height of 1.5 m above the ground plane. When maximizing the emissions from the EUT for measurement, the EUT and its transmitting antenna(s) shall be rotated through 360°. For each mode of operation to be tested, the frequency spectrum (based on findings from exploratory measurements) shall be monitored.

Test Note:

EIRP was calculated from measuring field strength by the following formula:

EIRP (dBm) = E (dBμV/m) + 20log(D) − 104.8

where

E (dBμV/m) = Measured amplitude level (dBm) + 107 + Cable Loss (dB) + Antenna Factor (dB/m)

where

Antenna Factor（dB/m) = 20log(F)-Antenna Gain(dBi)-29.76

Then the average EIRP reported below is calculated by:

EIRP (dBm) = Measured amplitude level (dBm) - Antenna Gain(dBi) + Cable Loss(dB) + 20log(F) + 20log(D) - 27.56

Where:

F: frequency (MHz)

D: Distance(m) = 3m

According to ANSI C63.26 4.2.3, Additional amplitude separation between the maximum input signal level and the spectrum analyzer reference level may be required if the signal under measurement is pulsed and its output power or PSD are to be averaged over the duty cycle. In this case, an additional amplitude margin relative to the reference level, determined from 10 log(1/duty cycle), may be required. For example, the reference level should be set 3 dB higher if the settings are based on power or PSD measurements that are averaged over a 50% duty cycle. This correction must be made in addition to the PAPR correction described above. When performing fundamental emission power measurements, the reference level setting shall be based on the maximum fundamental power at the input to the spectrum analyzer. As a measurement precaution, any signals input to the measurement instrumentation should be suspected of having the potential for overload until proven otherwise.

The measurement is operated on 20% duty cycle, the reference level should be set 7 dB higher.

B.1.5 Measurement Result

Note: We choose the worst modulation by the EIRP of middle channel, the high channel and low channel measure the EIRP only with the worst modulation.

The plots are showed in Annex D.1.

Note: The measured EIRP levels are below the TRP limit and the early exit condition is met.

Module0, Beam ID: 26,282

B.2 Emission Limit

B.2.1 Summary

The spectrum of FR2 n261 was scanned from 30 MHz to 100GHz. All modes of operation were investigated and the worst case configuration results are reported in this section.

30.203 (a) The conductive power or the total radiated power of any emission outside a licensee's frequency block shall be −13dBm/MHz or lower. However, in the bands immediately outside and adjacent to the licensee's frequency block, having a bandwidth equal to 10 percent of the channel bandwidth, the conductive power or the total radiated power of any emission shall be −5 dBm/MHz or lower.

B.2.2 Minimum Measurement Distance Evaluation

According to KDB842590 D01, the measurements of the fundamental emission, out of band, harmonics and spurious emissions shall be made in the far field of the measurement antenna. The far-field boundary for mmW antennas is greater than or equal to $2D^2/\lambda$ (with D being the largest dimension of the antenna, and λ the wavelength of the emission). We calculate the far-field boundary and the test distance meet the requirement of standard.

	Antenna model	D(mm)	λ(mm)	far-field boundary (m)	Measurement distance(m)
40-60GHz	LB-19-25	0.063891	0.0050	1.63	3
60-75GHz	LB-15-25	0.041231	0.0033	1.02	3
75-100GHz	LB-10-25	0.035609	0.0030	0.85	3

B.2.3 Measurement Method

The measurement procedures in ANSI C63.26 are used.

The spectrum was scanned from 30 MHz to the 5th harmonic of the highest frequency generated within the equipment. The resolution bandwidth is set as outlined in Part 30.203.

The spectrum is scanned with the mobile station transmitting at carrier frequencies that pertain to low, mid and high channels of FR2 n261.

ANSI C63.26 chapter 5.5.2.1: Such radiated measurements shall use substitution methods unless a test site validated to ANSI C63.4 requirements is utilized, in which case, radiated fundamental and/or unwanted emissions can be measured using the direct radiated field strength method.

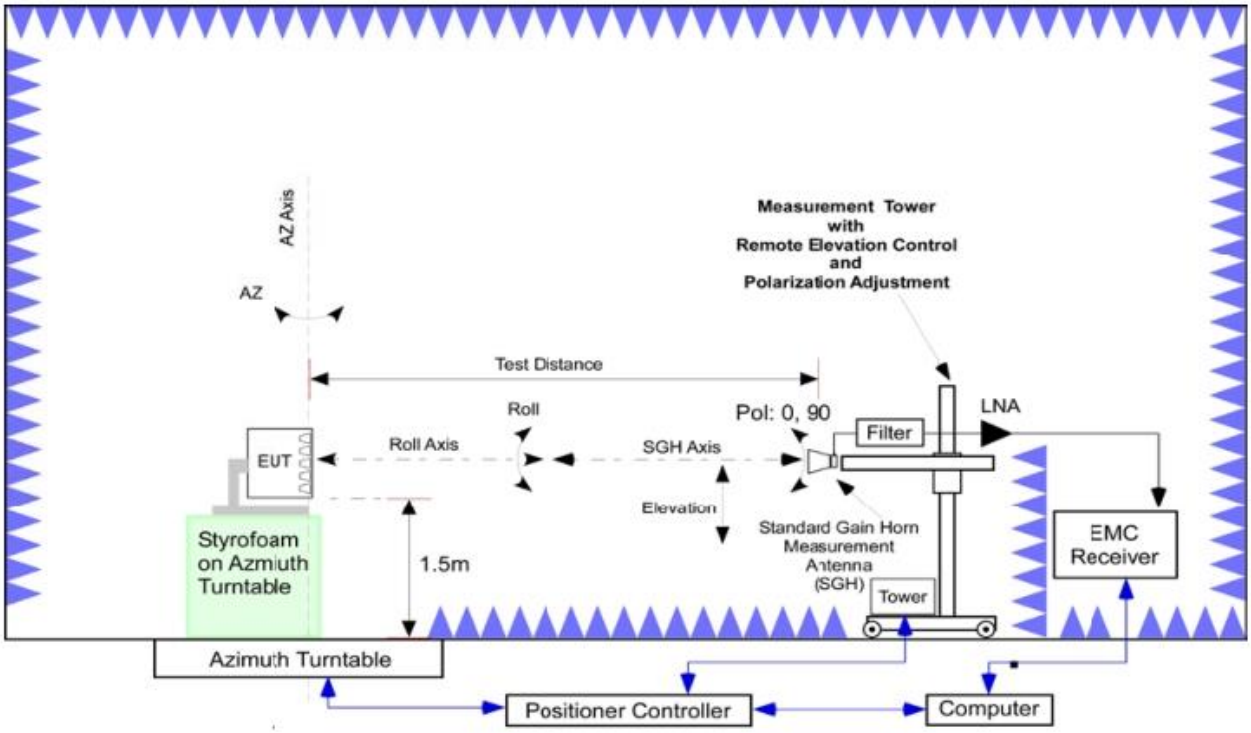
B.2.4 Test Procedure

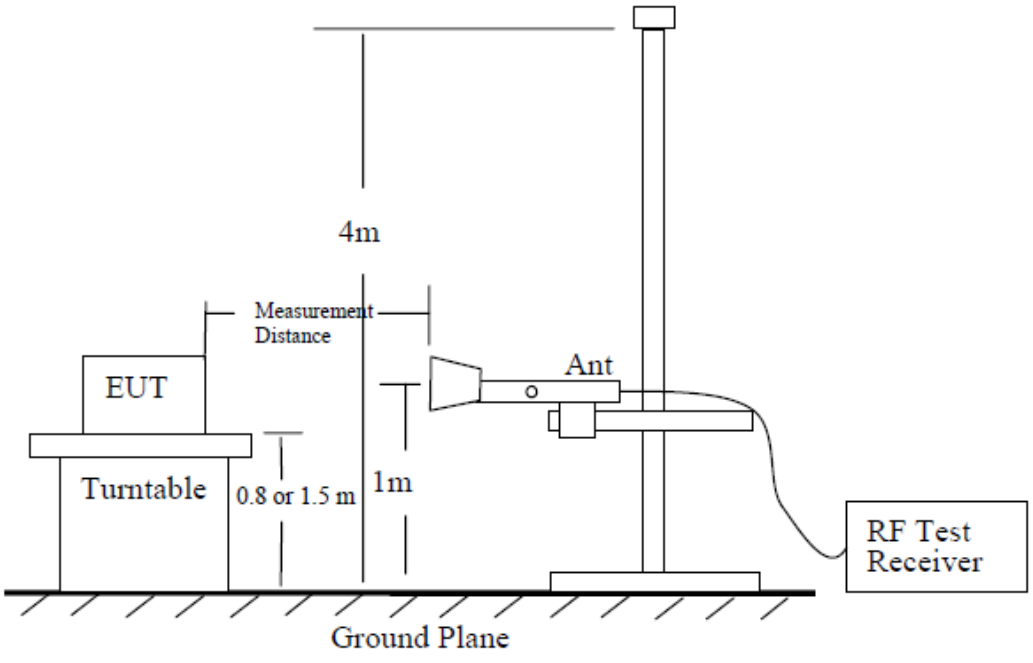
According to Clause 5.5 in ANSI C63.26-2015, 30.203 (b) and Clause 4.4 in KDB 842590 D01 v01r02

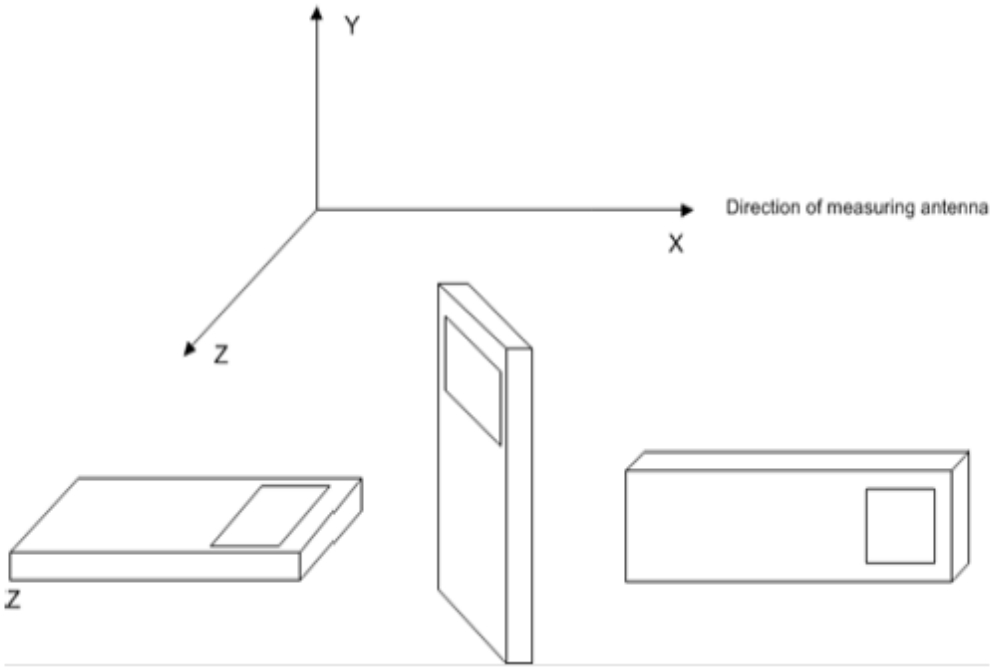
1. Set EUT at maximum output power
2. Select channels for each band and proper modulation
3. Set RBW=1MHz, VBW=3MHz
4. Set number of measurement points in sweep ≥ 2×span/RBW
5. Set Detector = RMS
6. Set Sweep time = auto-couple

7. Trace average at least 100 traces in power averaging (rms) mode
8. The trace was allowed to stabilize

Using the test configuration as follow, measure the radiated emissions directly from the EUT and convert the measured field strength or received power to ERP or EIRP, as required, for comparison to the applicable limits.







The emission characteristics of the EUT can be identified from the pre-scan measurement information.

Exploratory radiated measurements (pre-scans) may be performed to determine the general EUT radiated emissions characteristics and, when necessary, the EUT-to-measurement antenna orientation that produces the maximum emission amplitude. Pre-scans shall only be used to determine the emission frequencies (i.e., not amplitude levels). The information garnered from a pre-scan can then be used to perform final compliance measurements using either the substitution or direct field strength method.

For radiated emissions measurements performed at frequencies less than or equal to 1 GHz, the EUT shall be placed on a RF-transparent table or support at a nominal height of 80 cm above the reference ground plane. Radiated measurements shall be made with the measurement antenna positioned in both horizontal and vertical polarization. The measurement antenna shall be varied from 1 m to 4 m in height above the reference ground in a search for the relative positioning that produces the maximum radiated signal level (i.e., field strength or received power). When orienting the measurement antenna in vertical polarization, the minimum height of the lowest element of the antenna shall clear the site reference ground plane by at least 25 cm.

The radiated emission measurements of all non-harmonic and harmonics of the transmit frequency through the 5th harmonic were measured with peak detector.

For radiated measurements performed at frequencies above 1 GHz, the EUT shall be placed on an RF transparent table or support at a nominal height of 1.5 m above the ground plane. When maximizing the emissions from the EUT for measurement, the EUT and its transmitting antenna(s) shall be rotated through 360°. For each mode of operation to be tested, the frequency spectrum (based on findings from exploratory measurements) shall be monitored.

Final measurements shall be performed for the worst case combination(s) of variable technical parameters that result in the maximum measured emission amplitude, record the frequency and

amplitude of the highest fundamental emission (if applicable), and the frequency and amplitude data for the six highest-amplitude spurious emissions.

Test Note:

1. The average EIRP reported below is calculated by:

30M-18GHz: EIRP (dBm) = Spectrum Analyzer Level (dBm) + Path Loss(dB)

18GHz-60GHz: EIRP (dBm) = Spectrum Analyzer Level (dBm) - Antenna Gain (dBi) + Cable Loss (dB) + 20log (F) + 20log(D) - 27.56

60GHz-110GHz: EIRP (dBm) = Spectrum Analyzer Level (dBm) - Antenna Gain (dBi) + converter Loss (dB) + 20log(F) + 20log(D) - 27.56

Where: F: frequency (MHz), D: Distance(m), the distance for different frequency range as shown in table.

Frequency Range	Distance(m)	Frequency Range	Distance(m)
30MHz-1GHz	3	60GHz-75GHz	3
1GHz-18GHz	3	75GHz-100GHz	3
18GHz-40GHz	3		
40GHz-60GHz	3		

2. The TRP method refers to the Clause 4.4 of KDB 842590 D01 v01r02. If EIRP measurement results exceed the emission limit, then TRP measurement will be used as an alternative method.

B.2.5 Measurement Results Table (worse case of the power measured)

The plots are showed in Annex D.2.

Note: The measured EIRP levels are below the TRP limit and the early exit condition is met.

B.3 Frequency Stability

B.3.1 Summary

The frequency stability shall be measured by variation of ambient temperature and variation of primary supply voltage to ensure that the fundamental emission stays within the authorized frequency block.

B.3.2 Test Procedure

According to Clause 5.6 in ANSI C63.26-2015 and 2.1055

For temperature variation

1. Measure the carrier frequency at room temperature (20 °C to provide a reference)
2. At 10 °C intervals of temperatures between −30 °C and +50 °C
3. While maintaining a constant temperature inside the environmental chamber, turn on the EUT and allow sufficient time for the EUT temperature to stabilize

For supply voltage variation

1. The EUT was placed in a temperature chamber at 20 °C
2. The power is supplied by POE, and the test measured normal power only.

B.3.3 Measurement results

n261, QPSK

Frequency Error vs Temperature

OPERATING FREQUENCY: 27924960000Hz

POWER （VDC）	TEMP (℃)	Freq. Dev (Hz)	Relative Freq. Dev (Hz)
56	+20(REF)	14587.96	0
	-30	14772.3	184.34
	-20	14334.18	-253.78
	-10	14372.66	-215.3
	+0	14546.89	-41.07
	+10	14724.8	136.84
	+30	13113.27	-1474.69
	+40	14761.53	173.57
	+50	14304.61	-283.35

When the frequency stability limit is stated as being sufficient such that the fundamental emissions stay within the authorized bands of operation, a reference point shall be established at the applicable unwanted emissions limit using a RBW equal to the RBW required by the unwanted emissions specification of the applicable regulatory standard. These reference points measured using the lowest and highest channel of operation shall be identified as fL and fH respectively. The worst-case frequency offset determined in the above methods shall be added or subtracted from the values of fL and fH and the resulting frequencies must remain within the band.

The worst-case frequency offset is -1474.69Hz. The worst-case frequency offset added the values of fL and fH and the resulting frequencies are 27.550GHz and 28.299GHz. They remain within the

band 27.500GHz to 28.350GHz.

B.4 Occupied Bandwidth

B.4.1 Summary

occupied bandwidth (OBW) as the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean power is equal to 0.5% of the total mean power radiated by a given emission shall be measured.

No limit is applicable, the results are for reporting only.

B.4.2 Minimum Measurement Distance Evaluation

According to KDB842590 D01, the measurements of the fundamental emission, out of band, harmonics and spurious emissions shall be made in the far field of the measurement antenna. The far-field boundary for mmW antennas is greater than or equal to $2D^2/\lambda$ (with D being the largest dimension of the antenna, and λ the wavelength of the emission). We calculate the far-field boundary and the test distance meet the requirement of standard.

For fundamental or out-of-band emissions the largest far-field distance of either the EUT antenna or measurement antenna shall be used. For spurious emissions the far-field distance will be based on the measurement antenna.

	Antenna	D(mm)	λ(mm)	far-field boundary (m)	Measurement distance(m)
18-40GHz	EUT mmW Antenna	33.65	16.8	0.37	3

B.4.3 Test Procedure

According to Clause 5.4 in ANSI C63.26-2015 and 2.1049

1. The spectrum analyzer center frequency is set to the nominal EUT channel center frequency. The frequency span for the spectrum analyzer shall be set wide enough to capture all modulation products including the emission skirts (typically a span of 1.5 × OBW is sufficient).
2. Set RBW = 1% to 5% of the anticipated OBW
3. Set VBW ≥ 3×RBW
4. Detector = Peak
5. Trace mode = max hold
6. Sweep = auto couple
7. The trace was allowed to stabilize

Test Note:

The average EIRP reported below is calculated by:

EIRP (dBm) = Spectrum Analyzer Channel Power Level(dBm) - Antenna Gain(dBi) + Cable Loss(dB) + 20log(F) + 20log(D) - 27.56

Where:

F: frequency (MHz)

D: Distance(m) = 3m

B.4.4 Measurement results

The plots are showed in Annex D.3.

Note: We choose the worst modulation by the power measured.

B.5 Band Edge Compliance

B.5.1 Summary

All modes of operation were investigated and the worst case configuration results are reported in this section.

30.203 (a) The conductive power or the total radiated power of any emission outside a licensee's frequency block shall be −13dBm/MHz or lower. However, in the bands immediately outside and adjacent to the licensee's frequency block, having a bandwidth equal to 10 percent of the channel bandwidth, the conductive power or the total radiated power of any emission shall be −5 dBm/MHz or lower.

B.5.2 Minimum Measurement Distance Evaluation

According to KDB842590 D01, the measurements of the fundamental emission, out of band, harmonics and spurious emissions shall be made in the far field of the measurement antenna. The far-field boundary for mmW antennas is greater than or equal to $2D^2/\lambda$ (with D being the largest dimension of the antenna, and λ the wavelength of the emission). We calculate the far-field boundary and the test distance meet the requirement of standard.

For fundamental or out-of-band emissions the largest far-field distance of either the EUT antenna or measurement antenna shall be used. For spurious emissions the far-field distance will be based on the measurement antenna.

	Antenna	D(mm)	λ(mm)	far-field boundary (m)	Measurement distance(m)
18-40GHz	EUT mmW Antenna	33.65	16.8	0.37	3

B.5.3 Test Procedure

According to Clause 5.7 in ANSI C63.26-2015 and Clause 4.4 in KDB 842590 D01 v01r02

1. Start and stop frequency were set such that both upper and lower band edges are measured.
2. Span was set large enough so as to capture all out of band emissions near the band edge
3. Set RBW=1MHz, VBW=3MHz
4. Set number of measurement points in sweep ≥ 2×span/RBW
5. Set Detector = RMS
6. Set Sweep time = auto-couple
7. Trace average at least 100 traces in power averaging (rms) mode
8. The trace was allowed to stabilize

Test Note:

According to 4.4.2.5 in KDB 842590 D01 v01r02, the conducted power is calculated by:

Conducted Power Level (dBm) at any frequency/BW = Measured EIRP (dBm)/BW – EUT antenna Gain (dBi)

The average EIRP reported below is calculated by:

EIRP (dBm) = Spectrum Analyzer Level (dBm) - Antenna Gain (dBi) + Cable Loss (dB) + 20log (F)

+ 20log(D) - 27.56
Where: F: frequency (MHz), D: Distance(m)

B.5.4 Measurement result

n261

Note: The measured EIRP levels are below the TRP limit and the early exit condition is met.

Note: The channel with the maximum power was chosen.
