Subject: Additional Information Request

---

Message:

Hello,

In response to question with reference number 65686, our response is provided below:

Background:

At the time of our original experimental license application was submitted, the experimental license was for a single MyRadar (MyRadar1) satellite.

Since then, we have developed 3 additional MyRadar Satellites (MyRadar2, MyRadar3, and MyRadar4) with completely identical design, construction, configuration, capabilities, and orbits. These duplicates are to provide additional opportunities to prove our satellite experiments are successful in the event our first, MyRadar1 satellite, fails to complete the mission objectives.

Discussion:

ACME would appreciate the Commission's guidance regarding the experimental license process in how it relates to seeking approval for one satellite vs multiple satellites. The four MyRadar satellites (given above) are identical in construction and characteristics and therefore ideally request that all four satellites are covered under this application. If this is possible, and won't cause delay to the application approval process then our response is 4 satellites.

If the addition of satellites (adding MyRadar2-4) will cause major delay or disruption to the current application that is in-process, then it is preferred to maintain a single satellite.

We respectfully request for your guidance and advice in this matter.
