

Exhibit 1

STATEMENT DESCRIBING STATION USAGE

AlliedSignal designs and sells a complete line of airborne Weather Radar equipment. At the Olathe KS site the Weather Radar equipment is for General Aviation aircraft. This station request is for a roof top location to be able to operate the various Weather Radar equipment that we have in production as well as to operate new experimental designs during the stages of development. This facility is needed so that these various radars can be tested against actual weather formations to observe and record their performance. The radars in production will, from time to time, need to be tested for possible problems or auditing purposes. The new units in design will use this facility to test new features and prove out new concepts.
