

Description of the Nature of the Nationwide Research Project Environmental Monitoring

Accipiter Radar provides data to clients of an environmental nature. The radar sensor data is used to improve understanding of bird activity, local weather and river surface conditions. Accipiter Radar may be called upon at any time to provide a local site anywhere within the United States. At times, short demonstrations are required at the client's location. Should the Commission require, Accipiter Radar will license each fixed site separately should the client choose to purchase services after a demonstration. Accipiter radar can further restrict the scope to operation at waterside locations on the shores of navigable waterways (e.g. Lake St. Clair, Detroit River, Lake Huron, and Lake Michigan) where marine radars are in routine operation if it is not possible to obtain a nationwide license. However, a nationwide license would be beneficial to all environmental monitoring projects undertaken by Accipiter Radar.
