Subject: Additional Information Request

Message:

This note responds to the Commission's request for additional information as to the Effective Radiated Power (ERP) metric proposed. An agency reviewing the application as part of the coordination procedures questions whether the ERP is accurate.

The inquiry is correct and reveals an error made in the application. Instead of an output power of 10 watts, the correct metric for the transmitter is 2 watts. With this adjustment and addressing system losses and system gain, the ERP level should 2 watts.

An amendment to the application has been submitted reflecting an output power of 2 watts and an ERP of 2 watts.

I apologize for this error; it should have been caught prior to filing. We appreciate the review and courtesy of the inquiry and ask for further consideration of the modified application.
