Donald G. Everist, being duly sworn upon his oath, deposes and states that:

He is a graduate electrical engineer, a Registered Professional Engineer in the District of Columbia, and is President, Secretary and Treasurer of Cohen, Dippell and Everist, P.C., Consulting Engineers, Radio - Television, with offices at 1300 L Street, N.W., Suite 1100, Washington, D.C. 20005;

That his qualifications are a matter of record in the Federal Communications Commission;

That the attached engineering report was prepared by him or under his supervision and direction and

That the facts stated herein are true of his own knowledge, except such facts as are stated to be on information and belief, and as to such facts he believes them to be true.

Donald G. Everist
District of Columbia
Professional Engineer
Registration No. 5714

Subscribed and sworn to before me this 23rd day of August, 2007.

Notary Public

My Commission Expires: 2/28/2008

Introduction

The enclosed information describes the results of a digital analysis using the Commission's DLPTV program of Caterpillar's proposed electromagnetic compatibility testing at the Tucson Proving Ground.

In order to provide a more comprehensive overview of the equipment immunity testing procedure, the following information is provided in two sections.

Section 1 is a description of how the immunity testing is conducted.

Section 2 has been prepared by this firm and provides an interference analysis of licensed and authorized full-service television stations (NTSC and DTV) as well as translator, low-power, and Class A TV broadcast facilities utilizing the FCC's DLPTV program.

The following tables were developed for Section 2:

- Table 1 (over 0.5 percent)
- Table 2 (unmodified ratios)
- Table 3 contains a list of all the channels on which the hypothetical, worst-case EMC testing is predicted to cause less than 0.5 percent interference to existing television stations (Channels 2-69).
- Exhibit E-1 through E-8 provides site elevation data.
- Exhibit E-9 provides the test site property plat.

SECTION 1
Caterpillar, Inc.
Summary of Proposed EMC Testing Procedures

Caterpillar has requested an experimental authorization to conduct electromagnetic compatibility (EMC) immunity testing on the channel edge of specified channels in television band at its Peoria Proving Grounds and Tucson Proving Grounds sites. Caterpillar typically conducts outdoor EMC testing on its large equipment approximately 10 times per year.

The EMC testing is directed to critical electronic components on large earth moving equipment that could potentially be affected if operated in a high electromagnetic field environment. The EMC testing is conducted across a large number of frequencies to ensure both product safety and compliance under different international regulatory schemes, including those of the European Union.

Testing Procedures

EMC immunity testing involves illuminating the equipment under test with an electromagnetic field of specified, uniform electric field strength across the applicable frequency range. Because of the wide range of frequencies that the equipment under test must be subjected to, various antennas are used in the testing phase. These include horn style, log periodic yagi, and other broadband antennas. The antennas are typically mounted two meters or less off the ground and three to five meters from the equipment under test. The antenna radiation pattern will be omnidirectional below 200 MHz (biconical antenna) and directional above 200 MHz (log periodic antenna).

Industry and internal standards for Caterpillar earth moving equipment require testing of electronic systems on machines at a field strength level of 100 V/m. The transmitter output power required for testing at this field strength varies due to the efficiency of the antenna at a given frequency. At lower frequencies where the transmitting antenna is an inefficient radiator, the transmitter output power will be much greater than the ERP due to high-reflected power. At high frequencies where the transmitting antenna has significant gain, the transmitter output power will be much lower than the ERP. Caterpillar has requested 500 watts of effective radiated power to conduct this testing, although the actual transmitter power output will be much less in most cases.

The test signals will be centered at the edge of any television channel used and will have a maximum bandwidth of 2 kHz at frequencies below 800 MHz. Above 800 MHz, the maximum bandwidth is 20 kHz. The transmitted test signal is either an unmodulated carrier an 80 percent AM modulated at 1 kHz, or pulse modulated (only above 800 MHz).

Starting at the lowest frequency of interest, the signal generator is stepped through the frequencies of interest by computer control. The computer normally dwells on one particular frequency for less than 10 seconds per frequency sweep. A normal test regimen consists of six frequency sweeps (three antenna positions x two antenna polarizations) over the course of several hours. Given these parameters, the transmitter duty cycle at any particular frequency is approximately 60 seconds (or .4 percent) for a four-hour test.

Interference Mitigation

The likelihood of interference with broadcast signals is low and will be reduced in the following ways:

1. Antennas mounted close (2 meters or less) to the ground and close (3 to 5 meters) to the equipment under test which will greatly limit the range of the transmitted signal
2. Use of directional antennas for all frequencies above 200 MHz
3. Test signal centered at the edge of any television channel with a maximum bandwidth of 2 kHz.
4. Dwell time on any frequency is less than 10 seconds
5. The outdoor testing occurs infrequently (once every several months)
6. The outdoor test site is in a low-lying area relative to surrounding terrain, which will limit signal propagation

In addition, Caterpillar personnel will be present for all aspects of the investigation, testing will be coordinated with various public safety agencies in the area, and standards of good engineering practice will be followed, with applicable FCC rules available as a reference.

SECTION 2
Interference Analysis

As documented, the DLPTV testing demonstrates that Caterpillar's EMC testing causes less than 0.5 percent interference predicted on a number of television channels. The DLPTV program assumes a maximum HAAT height of approximately 30 meters. The actual antenna is used at a reference height above ground of approximately 2 meters. Therefore, this analysis should be very conservative.

A study of predicted interference caused by the proposed 0.5 kW experimental low-power digital operation has been performed using the Longley-Rice program for which the source data has been posted by the Commission on its website at http://www.fcc.gov/oet/dtv/dtv_apps.html. The FCC's FORTRAN-77 code was modified only to the extent necessary (primarily input/output handling) for the program to run on a Microsoft Windows XP/Intel platform. Comparison of service/interference areas and population indicates this model closely matches the FCC's digital low-power TV/translator evaluation program. Best efforts have been made to use data and calculation identical to the FCC's program. The model employs the Longley-Rice propagation methodology and evaluates in grid cells of approximately 1 sq. km. Using 3-second terrain data sampled approximately every 1.0 km at one-degree azimuth intervals with 1990 census centroids, all studies are based upon data in the current CDBS database update of the FCC's engineering database. A Longley-Rice study was performed with the proposed 0.5 kW experimental low-power digital facilities and all relevant stations listed in the FCC data base as of July 10, 2007. The study results and the included stations are provided in Table 1 through Table 3. They are as follows:

- | | |
|---------|--|
| Table 1 | Provides the stations for each channel (2-69) in which over 0.5 percent interference has been determined |
| Table 2 | Provides the unmodified ratios used from the DLPTV program |

- Table 3 Provides the stations (2-69) in which less than 0.5 percent interference has been determined.
- Exhibit E-1 thru
Exhibit E-8 Provides the eight cardinal radial profiles of the elevation from the equipment under test site versus the surrounding area.
- Exhibit E-9 Provides the map of the Caterpillar proving ground property in relation to the equipment under test site and the location of the eight cardinal radials.
