

GPS Repeater

GPS repeater will be installed inside a “test booth” The test booth is constructed of metal including doors, walls and ceiling. This test booth is inside a large metal industrial building. The GPS repeater will be used intermittently to configure GPS receivers on a production line that manufactures farming combine machines. The GPS repeater will not be powered if it is not being actively used for the above purpose. Do to the construction of the building where the repeater is transmitting, unwanted radio emissions will not radiate beyond the walls of this facility.
