Mr Trevino

Purpose of the operation.

Testing remote sensors in various locations within home under varying conditions with base receiver station used in home automation application to verify product design.

Description of the operation.

A maximum of 12 sensor transceivers will perform periodic update of sensory data to route to base receiver. We are attempting to verify that the configuration design parameters will remain under the requirements 15.231e for unlicensed intentional periodic radiators. Note: The base unit receives the data provided by the sensor network to perform control operations. The sensor remote units will not be fixed in location within the room, but we do not consider these units to be mobile devices. The sensors will be completely self contained (either battery or powered by adapter).
