

Datron World Communications, Inc.
FCC Form 405
Station WE2XZP
Application for Renewal

Description of Research Project and Request for License Renewal

Datron World Communications, Inc. (“Datron”) hereby submits the attached application to renew the experimental license for station, WE2XZP to permit Datron to continue testing equipment that it manufactures for its customers, which include the FBI, the National Guard, and the U.S. Army, and a host of other critical federal, state and local entities. There will be no change to any of the parameters of Datron’s current operations.

Consistent with its original application and subsequent renewals, although Datron is authorized to use the equipment at 1000 watts ERP, Datron generally tests its equipment at a lower ERP. Any testing of non-fixed units performed outside of its factory (which occurs only 30 days a year), are operated in remote areas where co-channel licensees are unlikely to be present. With respect to the testing that is performed at Datron’s factory, the Commission can easily determine the source of any interference in the unlikely event that Datron produces any interference. There have been no reports of interference from Datron’s operations to date. Accordingly, Datron respectfully requests that the Commission grant its renewal, so that it may continue its equipment testing for its critical customer base.
