Doug Lockie of Endgate stopped my office last night to check on the status of their application. He explained their experiment, wherein they intend to do a sort of adaptive power control to control signal beamwidth and fit into the existing 38 GHz environment. [He mentioned that they have already discussed with two licensees in the area and have their approval to go ahead.]

I told him that I would check into status and that it was likely that by this time the application had been sent to Wireless for coordination, since their licensees would be affected (I didn't think about necessity to go through FAS.) He said that he hadn't thought about the need for us to coordinate with other offices; and if it would be helpful to getting the application approved, he would provide additional information about their intention to coordinate with the licensees in the field. If you don't expect a problem, then that won't be necessary.

Please call Tom Smith of Endgate at 408-737-7300 and let him know you are calling in response to Doug's inquiry. Tell him that he should be receiving, or already received, the STA. Let him know how much time it should take to complete processing the application. Tell him that we don't expect any problem with approval (true?), but if it should arise that we might need to obtain more info from Endgate and might have to condition the license to require prior coordination with existing licensees before the experiment can be turned on.

If questions arise from Wireless or FAS, you could let them know that Endgate is talking with licensees in the field.
