

FedEx is working with partner Nokia to evaluate and trial a LTE system operating in the frequency range of 3650-3700 MHz. Note: this trial area is outside the exclusion zone defined by NTIA (TR-15-517r1). This STA extension is critical to the continued exploration of additional use cases for security cameras for worker safety and others, as well as moving to a different frequency range and testing new transmitters. In extension of the study, additional coverage and performance measurements will be conducted to determine the feasibility of this network access method for the above-mentioned use cases.
