Hillsboro, Or
97124

CTG / EPL is in the business of creating compelling, visionary technology building blocks used to showcase and highlight the features and capabilities of Intel computing microprocessors and supporting silicon products. These building blocks are often demonstrated at a wide variety of external and internal technology and industry trade shows and events world wide.

Currently we are focusing our efforts on creating next generation cellular mobile phone concept terminals based on Intel's growing portfolio of high performance silicon products.

These concept, prototype terminals use FCC approved GSM / GPRS based band radio technology and but are generally used indoors within large presentation halls where there is usually no support for GSM / GPRS wireless signals. To be successful in developing and showcasing our technology we need to have a reliable, dependable wireless infrastructure such that we can focus our energies on our development efforts rather than wireless network issues.

Our intent in applying for this license is to continue our basis research in mobile terminal development as well as support demonstrations of our resulting technology at industry forums and events.
