Message:

Doug Young

As described below, NASC agrees to restrict operations to 400 AGL or below while using the ISM bands 902-938 MHz and 2400-2500 MHz for C2. NASC will coordinate with FAA to determine what bands are approved by them. As of 4 June 2019 (FAA/AUVSI Symposium in Baltimore) they had not made any decisions and did not seem motivated to do so!

However, until we can contact the FAA to get a determination we will restrict operations to 400 AGL.

The FAA will not support Command and Control (C2) of UAS above 400 feet using ISM bands such as 902-928 MHz and 2400-2500 MHz. You will need to agree to operation at a maximum altitude of 400 feet or select other C2 frequencies. Alert this office as to what your choice is
