Each ThinSat-2 satellite is a collection of individual ThinSat units (ranging from 1 to 7 units) connected together in series with the exception of ThinSat-2E, which is a box unit. The ThinSat-2 satellites are packed into two canisterized satellite dispensers on board the second stage of the Antares launch vehicle. Post-release from the launch vehicle, the multiple unit satellites will unfold and be maintained in an "open" position through the aid of memory metal hinges.
