RW Systems is engaged in a design and development program for VLF communications.

This project is attempting to design and manufacture high efficiency antenna systems for the 160-190 KHz band.

This VLF band is expected to have a high potential for many new users.

We have monitored the frequency of 163.95KHz for 6 months and the frequency is not being used in this area.

This license is needed to develop and test antenna components and systems.
