

EXHIBIT 2
LICENSE USE
0428-EX-PL-2008

The facility requesting the license is a Rockwell Collins Engineering lab developing airborne weather radar for commercial use in business and air transport aircraft. The transmitting radars will provide live weather radar data used for analysis, software development and verification. The weather radars enhance a pilot's overall situational awareness and provide weather avoidance information so that pilots know "what's out there" and can provide the safest and most comfortable ride possible for passengers. With weather detection ranges of up to 320 miles and available Doppler™ turbulence detection at ranges of up to 50 miles, Rockwell Collins' weather radars gives advanced notice to select the smoothest, most-efficient routes around dangerous weather systems.
