

SRI International S-band High Altitude Balloon Radar Experiment

This document describes SRI International's high altitude balloon radar experiment and the need for Special Temporary Authority (STA) license through the FCC.

Experiment Overview

SRI is planning to test an experimental S-band radar system on a high altitude balloon. The balloon tests are expected to take place once a month between the second week of August to the second week of January. This window is allowing for multiple flights of the instrument for risk reduction testing, as well as flight reschedules due to problems with weather or equipment malfunctions. The radar system is designed to generate synthetic aperture radar (SAR) for the purpose of characterizing the ground backscatter for various Earth Science applications. The radar system is built by SRI International and consists of a custom transmitter, receiver unit, and antenna unit. In addition to the radar, the balloon payload will include a 900 MHz communication link that allows data and control command transfer between the airborne balloon and a nearby ground station. Also, on board is an Iridium and Inmarsat communication link that allows telemetry transfer between the airborne balloon and Iridium or Inmarsat satellites. Lastly, the payload includes a commercial C-band communication link manufactured by Cambium Networks for a higher data rate direct-to-ground downlink.

The balloons planned ascent will be near Truth and Consequences, NM, latitude/longitude of approximately 33N to 34N, 107W to 108W. While aloft, the balloon will fly at altitudes between 55,000 and 65,000 ft, with a target altitude of approximately 60,000 ft. The anticipated area of operation is between 32N to 35N latitude, and 105W to 109W longitude. The radar will operate periodically over the flight path, transmitting once about 3 minutes for every 10 minutes while aloft. During operation the payload will be pointed at 33.16N latitude 106.4890W longitude, or 32.3808N latitude 106.4793W longitude, commonly known as Jalen point and Main Post, respectively. The balloon-ground station links will be operated more regularly over the flight path to upload payload commands and downlink radar data and telemetry. Because the intent of the experiment is to image the ground, the radar antenna will always be pointed at an elevation angle below the horizon.

Balloon Payload Radar Description

The SRI radar consists of a custom S-band transmitter and receiver unit designed and built by SRI International. The radar transmits a pulsed linear FM chirp signal over **2.93625 to 3.35GHz**, having an instantaneous BW of **200 MHz** bandwidth. The transmitter outputs the waveform with an average power of about 60 W. A 21 dBi gain antenna is used with the transmitter, resulting in an EIRP of 7500 W average. The radar will operate with a maximum pulse repetition frequency (PRF) of 4000 Hz, a maximum pulse width of 100 microseconds, and a duty cycle of 10%. The radar antenna has a beamwidth of 10 deg in the azimuth (horizontal) plane and 27 deg in the elevation plane. The directive antenna will be pointed at a depression angle between 10 and 70 deg below the horizon. Figure 5 shows a schematic of the SRI S-band radar system. Prior to launching the balloon, the radar will be tested on the ground in Truth and Consequences, NM to check EMI emissions.

The radar transmitter has the following emission mask, which was measured in the laboratory with a spectrum analyzer at 1 MHz resolution bandwidth

- -3 dB bandwidth: 200 MHz
- -20 dB bandwidth: 215 MHz
- -40 dB bandwidth: 228 MHz
- -50 dB Bandwidth: 240 MHz

Spurious and harmonic emission measurements were also made of the radar transmitter outputs:

- Spurious emissions over 2.93625 to 3.13625 GHz: -50 dBc
- Spurious emissions out of band: -50 dBc
- Harmonics: -50 dBc

The radar center frequency is tunable up to 3.25 GHz; the emission mask and spurious/harmonic measurements translate with the center frequency.

UHF Ground-Balloon Communication Link Description

While the balloon is airborne, SRI will maintain communication with the balloon radar payload via a 900 MHz ISM-band communication link. Both the ground station and the balloon will utilize a Digi XLR Pro commercial transceiver that operates over 910 to 920 MHz. The transceiver utilizes a chirp spread-spectrum waveform to minimize interference with other transceivers. For the ground station, the transceiver unit will output an average power of 1 W and be connected to a 13.5 dBi gain antenna for an average EIRP of 22 W. For the balloon side of the link, the transceiver unit will output an average power of 1 W and be connected to a 3 dBi gain antenna for an average EIRP of 2 W. While the balloon is aloft SRI will operate a mobile ground station that will follow the balloon flight path on the ground and maintain periodic communication with the balloon payload. SRI will utilize a maximum of two mobile ground stations along the balloon flight path at a time.

L Band Satellite-Balloon Communication Link Description

The Iridium link is a commercial off the shelf satellite communications solution. The Iridium link uses Time-Division Multiple Access (TDMA) and Frequency-Division Multiple Access (FDMA) transmission schemes, with a Differentially Encoded Quadrature Phase Shift Keyed (DEQPSK) modulation scheme. The Iridium satellite constellation operates from 1616MHz to 1626.5MHz. The balloon will have two of these Iridium links. Each of these links average RF power is ~7W, and a standard 3dBi “Hockey Puck” antenna is connected, giving a EIRP of ~14W. The beamwidth is ~145 degrees.

C Band Ground-Balloon Communication Link Description

The C Band link is a commercial off the shelf satellite communications solution, purchased from Cambium Networks. The Cambium Networks link uses Time-Division Duplex (TDD) transmission scheme, with a fast preemptive adaptive modulation scheme, featuring 13 modulation/FEC coding levels ranging from BPSK to 256 QAM dual payload MIMO. The Cambium Networks link operates from 4.9GHz to 6.05GHz, with allowable frequencies and bands dependent on country of operation regulations. The link will be restricted to operation between 5.25 and 5.6GHz to avoid potential interference with DSRC systems supporting public safety in the 5850 - 5925 MHz band, to avoid potential interference with Radio Astronomy in the 4.990 - 5.000 GHz band, and to avoid potential interference with FAA AAG bands from 5-5.25GHz and 5.6-5.65GHz. The system picks the least-occupied channels available, but can be configured to disable a list of specific channels. The balloon will have one Cambium Networks PTP670 Transmitter, and the mobile ground station has one as well. Each of these transmitters peak RF power is ~0.5W. These transmitters are certified to comply with FCC 47 CFR Part 90 (Outside the UNII band) and Part 15e (inside the UNII band), FCC Identifier QWP-50670. The balloon has a MARS 23dBi dual polarization panel antenna, part number: MA-WA56-DP23B, giving an EIRP of ~100W, this antenna has a 3dB beamwidth of ~10 degrees in both V and H planes. The ground station has a MARS 26dBi dual polarization antenna, part number: Mars MA-WA55-27-B, giving an EIRP of ~200 W, this antenna has a 3dB beamwidth of ~7.5degrees in both V and H planes.

Balloon Flight Path

The balloon will launch from Truth and Consequences, NM, it will ascend to its nominal operating altitude of 60,000 ft. SRI is requesting the STA license to operate the radar and comm link at any location within the anticipated area of operation between 32N to 35N latitude, and 105W to 109W longitude at balloon altitudes up to 60,000 ft. SRI also plans to operate the balloon radar and comm link while the balloon ascends from Truth and Consequences, NM at altitudes between 5,000 and 60,000 ft. The ascending area of operation is between 33N and 34N latitude, 107W and 108W longitude. During the experiment, SRI operators will be able to disable the radar and/or radio transmitter at any time. Transmission of the radar and/or radio can be stopped by contacting either of the following SRI personnel:

- Lauren Wye: 650-678-9184
- Simon Lee: 805-801-9223
