

Frequency Coordination with FAA

As requested, I contacted the FAA office responsible for frequency management in the Western Region.

John Hepsen (FAA) (602-431-2283) coordinating with FAA Washington has interviewed us regarding our intended use of the requested frequency band and has granted approval for us to use the frequency assignment of 111.600 MHz under the power, modulation and bandwidth conditions and at the location specified within this application.

Mr. Hepsen has consented for me to include his name and phone number in this exhibit to be contacted for confirmation of this approval.

This is understood to be a temporary assignment of this frequency for the period requested and any additional need beyond the scope of this application will be preceded with a new request for authorization.
