Message:

The operation to be conducted consists of testing of a prototype FMCW radar. The radar will be setup on shore for brief tests of its ability to detect small objects nearby on the surface of the ocean. A small boat will be used as the platform to carry the objects. Tests will be brief, usually lasting no more than a couple of hours. No more than a few tests are planned during the 6 month period of the STA. Encinitas city officials have been contacted to ensure there is no issue with the setup and use of the equipment on city property.
