QUESTION 4: STATEMENT REGARDING GOVERNMENT CONTRACT

The proposed experiment supports Telcordia deliverables under a Department of Defense research program, Contract Number H98230-09-C-0280, for the Laboratory of Telecommunication Sciences. The project includes experiments to better understand vulnerabilities of critical infrastructure to natural and manmade phenomena. In particular we propose to conduct experiments on the impact of radio frequency interference (RFI) into advanced communications services such as broadband access. We propose to do this by running short term transmission experiments at a number of locations using conventional AM transmissions, but just below the commercial AM band to avoid interference with commercial broadcasts.
