

An existing Telephonics product, the TruLink Wireless Intercomm System FCC-ID RQASRR300ME, operates under 2.4 GHz ISM rules and is currently in use by the Armed Forces of the United States of America.

This experimental license is being requested so that a TruLink System can be created to operate in a preferred frequency band of the Armed Forces of the United States of America. Redevelopment of the base product will require experimentation, design, and test in the 300 Mz -400 MHz frequency band.
