

07-Jun-17

Overview of Request

Textron Aviation has been invited to give demonstrations and training on two multi-mission aircraft at Holloman AFB, beginning in mid-July, 2017. The operations require use of the Vortex transmitter. To avoid scheduling conflicts and provide maximum flexibility for frequency scheduling with Holloman AFB, we are requesting the band 4400-4950 MHz. This will enable us to tune the transmitter to a channel designated by the DoD frequency manager at the time of the events.

The operating area requested is more accurately described as follows:

Holloman AFB (KHMN), White Sands Missile Range, NM, Lat/Long:
32.8440°N, 106.0993°W, 100 nm radius (185.2 km) from headings 180° to 360°

Our maximum altitude will not exceed 45,000 ft MSL, and will likely be much lower.

Very Respectfully,

Dan Hankins
Spectrum Manager - Sr
Textron Aviation, Inc.
