

The purpose of this modification is to add as a point of communications the Sat-GE GE-23 satellite. This satellite is located at 172 degrees East longitude.

A coordination letter from Sat-GE is being provided as a separate attachment.

To facilitate testing of the Sat-GE GE-23 satellite footprint, which covers the North Pacific Ocean region, we are seeking authority to extend our AMSS and ESV operations beyond the 12 mile off-shore boundary.

Other than the addition of the point of communications and coverage area, no changes to the operational emissions of the existing license are requested.
