

We have requested the full frequency range of all ITFS/MMDS channels, from 2500 MHz to 2680 MHz (lower channel band edges are given, not carrier frequency or center frequency). The reason is to give us flexibility in finding a channel in each location which will either not be currently licensed, or if licensed, not in current use. Or, if neither of these situations occur, then to give us flexibility in coordinating with the most appropriate local licensee and operator within this frequency range.
