Subject: Additional Information Request

Message:

In past operations under this experimental license AT&T has coordinated its use in the 3700-4200 MHz band through an incumbent identification and coordination process using Commsearch. There have been no reported instances of interference. As part of the current renewal AT&T will conduct another identification and coordination process through Commsearch, we will also use the minimum power required for any test, and ensure that antenna angles, elevation, and beamforming are chosen to minimize potential for interference. Incumbents will be informed prior to any test and will be provided a point of contact at AT&T immediately involved with the testing to ensure rapid response to any concerns.
