In past operations under this experimental license AT&T has coordinated its use in the 3550-3600 MHz band through an incumbent identification and coordination process using Commsearch. This was prior to the rule changes and implementation of the CBRS band as it stands today. Since late 2019, AT&T has conducted commercial CBRS operations. As part of these operations AT&T has contracted with Commscope for coordination and management through its Spectrum Access System (SAS). Any future AT&T experimental use will utilize this SAS relationship. Commscope offers a CBRS Experimental / STA License Coordination Service explicitly designed to coordinate experimental use of the CBRS band with its own and other SASs to ensure interference free operation. AT&T will utilize this service prior to any experimental operations in this band.
