

Notes on Frequency and Power:

We do not require any particular frequency in the range 928-960MHz and will accept any particular frequency assigned. Alternatively, a frequency determined to be unused by the radio's scanning feature may be used to select an operating frequency least likely to interfere with any other emitters before each test.

The radios have an adjustable output power feature. The minimum power required to conduct effective required communications will be employed, up to the radio's maximum of 5W.
