

In response to question 6a:

BMH Associates is currently development of a Sonobuoy for the US military that will determine the source location of sounds in large bodies of water. We need radio equipment to send data from the buoy back to a ship or master station for processing.

In a final version these buoys will be used in the open ocean about 10 miles plus from the ship.

We need a single frequency that can be used for Naval and Marine as well as lab testing.
