

Effective April 27, 2018, BNSF Railway Co. was granted experimental STA to test transducer devices at two locations in Montana for determining effectiveness for use in Avalanche detection. Because the STA was granted in early spring, additional testing is desired during the winter of 2018-2019. BNSF thus requests a 180-day extension of its STA WM9XPL under the same technical parameters and conditions as contained in its current authorization.
