2) The trial will be measuring signal propagation characteristics (pathloss, channel impulse response, fading properties) of 60 GHz channels across a series of link distances and transmit levels. In addition the study will be testing achievable throughput using a 60 GHz technology PHY across the same links.

Options for channel center include 58.32 GHz, 60.48 GHz, 62.64 GHz, and 64.80 GHz. We are fine if FCC prefers we pick one and only test with it. If that is the case we'd prefer 60.48 GHz or 62.64 GHz.

2.16GHz channel bandwidth
