

DESCRIPTION OF RESEARCH PROJECT

Pursuant to Sections 5.3(j) and Section 5.61 of the Federal Communications Commission's rules, 47 C.F.R. §§ 5.3(j) and 5.61, CCO Fiberlink, LLC ("Charter"), a limited liability company and subsidiary of Charter Communications, Inc., seeks Special Temporary Authority ("STA") for 180 days, beginning April 4, 2018, or immediately upon grant, to test and evaluate millimeter wave coverage and capacity performance in anticipation of 5G wireless development.¹ As part of its efforts to lead the industry in broadband innovation, Charter intends to conduct fixed wireless experiments in the 28 GHz millimeter wave band. The proposed operations will advance Charter's understanding of 5G technology and network potential in the millimeter wave bands and will advance the potential deployment of 5G fixed and mobile services.

Charter will conduct the proposed test using antennas at a location in the Los Angeles, California area. These experiments will evaluate the 5G frequencies and technologies for their use in point-to-multipoint access network capacity (*e.g.*, rate versus range) and data throughput. The ultimate goal of these tests is to research the techniques and efficacy of fixed wireless broadband solutions in the 5G frequencies. The tests will utilize fixed transmitters with a 1 km or smaller effective radius. Due to limited use of the requested band in the proposed location, Charter does not anticipate that these experiments will cause harmful interference, and Charter will work closely with the equipment vendor to ensure no interference occurs.

¹ Charter was previously granted authority to conduct testing in the 28 GHz band in Los Angeles, California. See File No. 0295-EX-ST-2018 (granted Mar. 12, 2018). This STA seeks to modify slightly the frequencies requested under that authorization.
