Exhibit Information

The purpose of this continuing testing is associated with developing use of the Ka-band for broadband backbone and subscriber purposes. At this time the licenses are part of a network that will incorporate the use of Ka-band to serve Alaska and other underserved areas of the United States with Internet and other services. Associated with this program are several satellite authorizations held by the licensee for Ka-band operation. What is learned from use of the subject antennas will assist in providing more reliable service later.

The specific objectives are to evaluate reliability of satellite links as a function of weather and loading and to assess service provision through different periods of the year and weather conditions.

What is learned through the experimental use of these facilities will expand understanding of providing telecommunications in the Ka-band, which at this time is at the upper extreme of civilian use.
