Subject: Experiment equipment

The actual number of devices should be closer to 400 as shown here. The equipment breakdown will be 10 injection points to get the broadband signal onto the powerline, 167 transformers passed with repeaters, 100 residential user modems, 100 low voltage repeaters. The actual number of 500 was used to insure that we had enough devices if the customer interest was higher than estimated. We will also be testing several utility applications that will require 10 to 15 additional modems or repeaters.

The service will be offered free to everyone that participates in the trial.
