Necessary Bandwidth Calculation

The necessary bandwidth was determined using the equation in Annex J of the NTIA Manual¹ for FM-pulsed radars (see Equation 1).

$$B_n = B(-20 \text{ dB}) = \frac{1.79}{\sqrt{t_r \cdot t}} + 2B_c \quad (1)$$

where

B_n = necessary bandwidth, MHz
 t_r = pulse rise time, μs
 t = pulse width, μs
 B_c = frequency deviation (chirp) bandwidth, MHz

The Elbit FOPEN radar emission characteristics are given in Table 1. Applying these parameters to Equation 1, results in a maximum necessary bandwidth of 152.83 MHz.

Table 1 Emission Characteristics

Pulse width	0.4-2	μs
Pulse rise/fall time	1	μs
Maximum frequency deviation	150	MHz
