Ether Form Inc is verifying test equipment that is being manufactured at our engineering facility. This experiment consists of two ground stations communicating with each other over the air. Each ground station has one antenna. Each set of test equipment forms a directional communications link, or link under test. The pointing is software controlled and the locks on to the remote (i.e., other) antenna. Antenna scan volume is +/- 60 degrees.

The test does not include any type of directed energy, jamming, electronic attacks, spoofing, emulating, or replicating.
