

Requesting fee exemption as this 'experimental station' is to be considered a historic aviation non-directional beacon radiator operating on a defunct frequency formally occupied by a station in Spartanburg, SC. The purpose is to keep a vintage airport radio beacon station presence on the air for radio propagation studies as the federal government program to shut down all aviation band beacons expands, eliminating them all at some future date. This device will not radiate a navigational signal, but will identify itself as a historical device only.
