Principal Systems Engineer
SUBJECT: FORM 442 Applications

Nancy,

Attached is a copy of Page 2 for each of the two submissions we have recently submitted. The information for both submissions is the same.

The explanation of the experiment is:

HME is testing the use of passive Radio Frequency Identification Tags manufactured by Texas Instruments mounted on the underside of automobiles. The test utilizes their TIRIS Model S2510 Reader. The Reader is interfaced to an under ground loop antenna. The application for the product is for a parking security system in public parking facilities at office buildings and gated residential communities. The test is expected to run for 6 months to determine the viable use of the products for this application.
