

Exhibit 1-item 7

IncNETWORKS' program of research and experimentation will develop and test prototype enterprise (in-building and campus) wireless communications systems using small distributed base stations with software defined radio technology for voice, data, and multimedia traffic. These systems are intended to work with a variety of mobile devices (e.g., cellular and PCS telephones, PDAs, laptop computers). Cellular and PCS frequencies will be reused efficiently enabling new wireless services and coverage within congested corporate campuses and other problematic enterprise locations. This program is an extension and expansion of some of the experimental work already previously conducted by incNETWORKS for enterprise wireless communications systems (under call sign, WC2XTI).

The objective of this program is to demonstrate in field tests in multiple locations in New York City the feasibility of such enterprise wireless communications systems in a challenging urban environment.
