Insitu has been in discussions with Sirius XM radio regarding the above referenced application. Insitu's proposed use is outside of the frequencies authorized for use by Sirius XM. Nevertheless, to assure Sirius XM that Insitu's experimental operations will not pose a risk of harmful interference to Sirius XM's customers, Insitu has agreed to the following operational restrictions on its experimental operations. The conditions below, of course, do not relieve Boeing of its ongoing obligation to ensure that its experimental operations do not result in harmful interference to authorized users and to promptly cease operations if harmful interference results.

First, Insitu's fixed Boardman site will operate in its current location with a parabolic reflector positioned not higher than 50 feet AGL.

Second, the Insitu aircraft will refrain from engaging in any transmissions at altitudes below 1000 feet AGL and will also refrain from engaging in any transmissions if the aircraft flies within two (2) miles of I-84.

Please let us know if you have any questions about this matter.
