

Narrative: answers to question #7:

ITT builds radios which it sells to the US government as well as to other countries. Whenever possible the radios are tested in a cabled non-radiating environment in the lab. ITT has a need to do over the air testing to verify radio system operation in a realistic environment. We also need to do over the air testing to recreate problems reported by our customers and to verify that any fixes identified do indeed fix the problem. Verify radio system operation in a real world environment. Recreate customer identified problems. Verify any fixes really do fix the problem and do not create others.
