

ITT Corporation, Communications Systems Division, (CS) is a major military communications provider. Our primary focus is providing leading edge communications technology products for military and industrial applications.

ITT Corporation has applied for this license to perform intermittent testing on a developing product which is specifically targeted for the airport ground communications market as the FAA administration moves toward upgrading to the next generation of Airport communications. We believe this technology can provide the FAA with a solution that will fit its current and future needs for many years to come.

The product will be based on the relatively new WiMAX 802.16e mobile waveform protocol. Our testing will validate the condition of point to multipoint operation with multiple subscribers and evaluate the effect of multi-path conditions in an airport or similar environment.
