File Number: 0536-EX-PL-2006
Question 7 Exhibit

date: **September 26, 2006**

Exhibit Information

Lucent Technologies is seeking an application for an experimental license to support RF transmission at low power levels in four distinct frequency bands. This is in support of hardware and software development of GSM cellular communications equipment. The four frequency bands specified in the application are those bands used worldwide for GSM cell-phone communication.

This application would cover transmission of multiple systems from multiple antennas at power levels not to exceed 1 W ERP in the development labs in Westminster, CO. The specific frequencies, power levels, and antenna locations within the labs will change on a day to day basis depending on the specific hardware/software feature under design or test. This work will culminate in the release of GSM communications products periodically throughout the lifetime of the license.
