---

Message:

There are three (3) components in the system, named: locomotive radio, wayside radio, and base-station radio. Dispatching command is initiated from central traffic control to the wayside track switches through radios; locomotive also receives command to proceed to using 220 MHz radio. And locomotive uses peer to peer mode to communicate with wayside radio. We will demonstrate those three(3) radios to the potential customers to show that our radios have the capability and ability to transmit data.
