ELMSAR Reconnaissance Pod Operations:

Special Operations Considerations For The Aircraft Mounted Air Data Terminal

The air data terminal installed in the aircraft mountable pod will be operated such that antenna directivity will always be aligned with the ground station. Pod navigation information is used to control antenna pointing during operation. The ground station will be installed at the Richmond International Airport Air National Guard facility.

Special Operations Considerations For The Ground Data Terminal

The ground data terminal, located at the Richmond airport, will track the air data terminal during operation. Therefore ground antenna directivity will be aligned with the aircraft position.
