

Exhibit A

Program Description

This is a commercial off the shelf Terma 2001 frequency diversity radar which consists of two 25KW transceivers that radiate sequentially out of a common antenna on 9225 and 9438 MHz, respectively. The site is intended to be used as a long-term technology demonstration/evaluation platform. In addition to the X-Band diversity radar, the site will have an AIS base station nad VHF FM maritime band voice base station, both configured for receive only (no transmit capability). The site will be used, in part, for testing radar processing and sensor correlation software updates to benefit the UCG PAWSS installations. The site will also be used for demonstrations to potential customers in the coastal monitoring/security domain.
