

FCC License Request

The FCC license that has been requested for Red Bull is to support calibration and testing of the Red Bull system's capability for rapid and accurate Direction Finding. The Red Bull system is designed to support U.S. military personnel by quickly identifying and geolocating low power and high interest ground based signals. Red Bull has the potential to save many lives through the quick identification and geolocation of these types of threats.

Following flight calibration testing in September, the U.S. Army has requested integration of the Red Bull capability on a U.S. Army reconnaissance test aircraft for operational assessment in October. This is one of the driving factors to maintain the requested date for the FCC license.
