

Attachment I

This request, even though it is for a new station authorization, is actually an effort to re-license an authorization, WC2XOE, which was inadvertently allowed to expire in January 2009. The test range associated with this request has actually been in operations since 1983. The referenced authorization was granted to replace the original authorization, KO2XBQ, which the site allowed to expire in 1999.

All of the original approved technical details are unchanged and I have included all of the associated exhibits for this test range. I have included a copy of the expired authorization for your information and review. I am also under the assumption all of the previous NTIA records are still active for coordination purposes.
