

Exhibit II

The FCC license will allow live satellite RADILJ (STU) capability at the Lockheed Martin MS2 facility in Moorestown, NJ. It is required to support the development and requirement sell-off for the Aegis Ballistic Missile Defense Programs, contract N00024-03-C-6110. The missile defense program operates per the National Security Presidential Directive 23. This configuration will enable a process for utilizing live satellite communications between the Lockheed Martin Computer Program Test Site, United States Navy Combat System Engineering Development Site (Moorestown, NJ), Space and Naval Warfare Systems Command (multiple Locations), and the Joint National Integration Center (Colorado Springs, CO) and other government facilities to characterize “best”, “normal”, and “worst” case satellite communications (e.g. frequency of insufficient signal) environment.
