The frequencies requested are used in a research product called Crittercam. This involves small camera and transmitter packages that are deployed onto animals to conduct research into their lives and behaviors for conservation purposes. These projects are often conducted with field specialists that have access to certain types of animals. The research is conducted in remote areas where animals must be tracked electronically in their natural habitats. We are transmitting video images back to a user operated recording station that is fully wireless as well as telemetry controls on the device. We would like to amend the attached frequencies to our current license which is valid thru 2006. These new systems and frequencies will most likely be specifically used on captive and wild birds of prey through proper permitting.
