We've created a network designed to support testing of Nokia Mobile phone products. The network will use pretty much commercial SW (E4/E5 SW). The Core and RAN network is comprised mostly of Nokia Networks equipment. Core Network resides in Dallas. 5 Nokia R&D sites are backhauled to the core network (SD, SF, Boston, Vancouver, Dallas). The network is designed so that Nokia can test early prototype SW and HW in a controlled environment and avoid creating interference and performance affects on commercial networks. Because Nokia creates products for all frequency bands, we need the test network to support all the approved wireless frequency bands.
